Replacement parts for CBB also available

FEATURES

100% of JKP drill chucks are individually controlled to ensure not to exceed a maximum total integrated run-out of 0.0016"

The Self-Tighten feature automatically increases clamping, force proportional in increase torque to prevent tool shank slippage. This is standard for right-hand rotation applications, left hand rotation is available upon request.

The JKP Series drill chucks are well suited for use on drill presses with high accuracy, jig bore machines, horizontal rule and vertical milling machines, and production drilling machines

The CBB drill chuck has a key for industrial applications that require the toughest machining conditions. It's equipped with ball bearings to reduce friction in the tightening mechanism & provide a better grip on the drill shaft. The one-piece gear ring and sleeve eliminate the possibility of the teeth breakage.
